

DIRTS: Addressing Constraints to Agricultural Transformation in Northern Ghana

Christopher Udry
Professor of Economics
Northwestern University

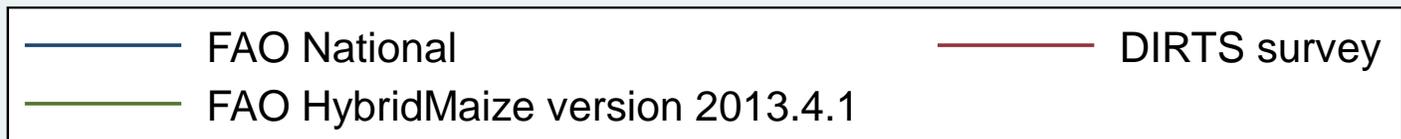

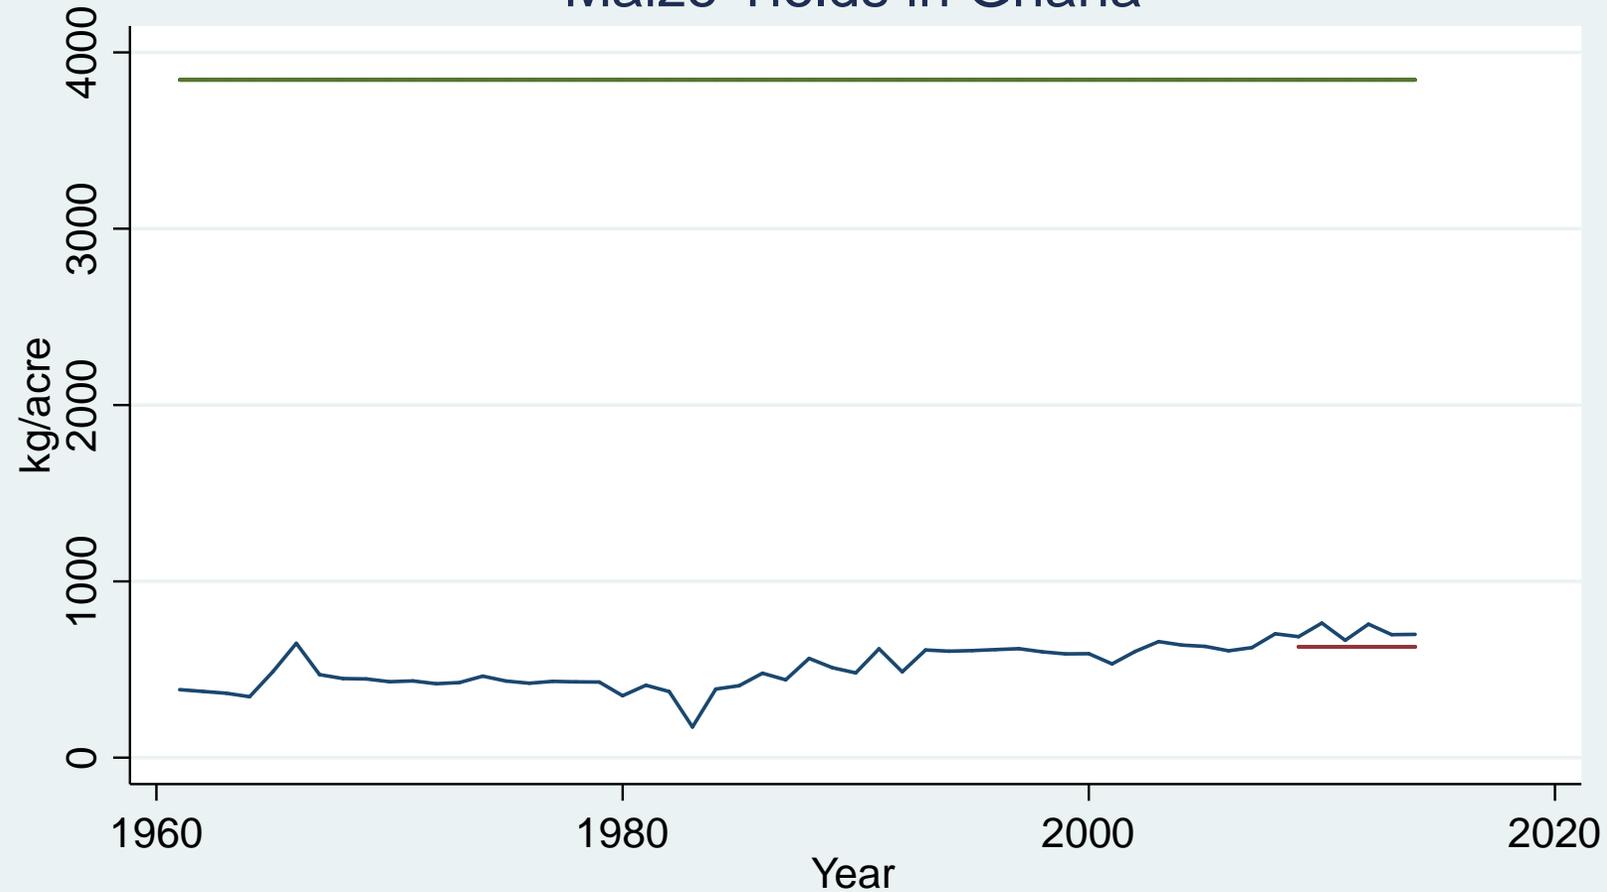

9 May 2018

Maize Yields in Ghana

Maize Yields in Ghana

How can we increase agricultural productivity in northern Ghana?

- **Many possible barriers:**
 - Previous findings: Using insurance to reduce farmers' risk frees them up to invest more in inputs
 - Capital constraints?
 - Knowledge of best practices?
 - Timely access to inputs?
 - Information on output prices; weather forecasts?

DIRTS Key Findings

INFORMATION

- **Community Extension Agents improve knowledge and practice by 3% to 50% depending on the practice.**
 - Timing of the message matters
- **Adoption of improved practices by some farmers did not translate into measurable increases in average yields or profits for the group as a whole.**

DIRTS Key Findings

INFORMATION

- **Farmers adjust timing of planting and agrochemical application in response to text messages of 48-hour weather forecasts**
- **Text messages regarding current prices of grains at major markets influence decisions regarding storage**

DIRTS Key Findings

RISK

- **There is limited demand for rainfall index insurance**
- **But farmers granted substantial amounts of rainfall index insurance invest more heavily in agrochemical use**

DIRTS Key Findings

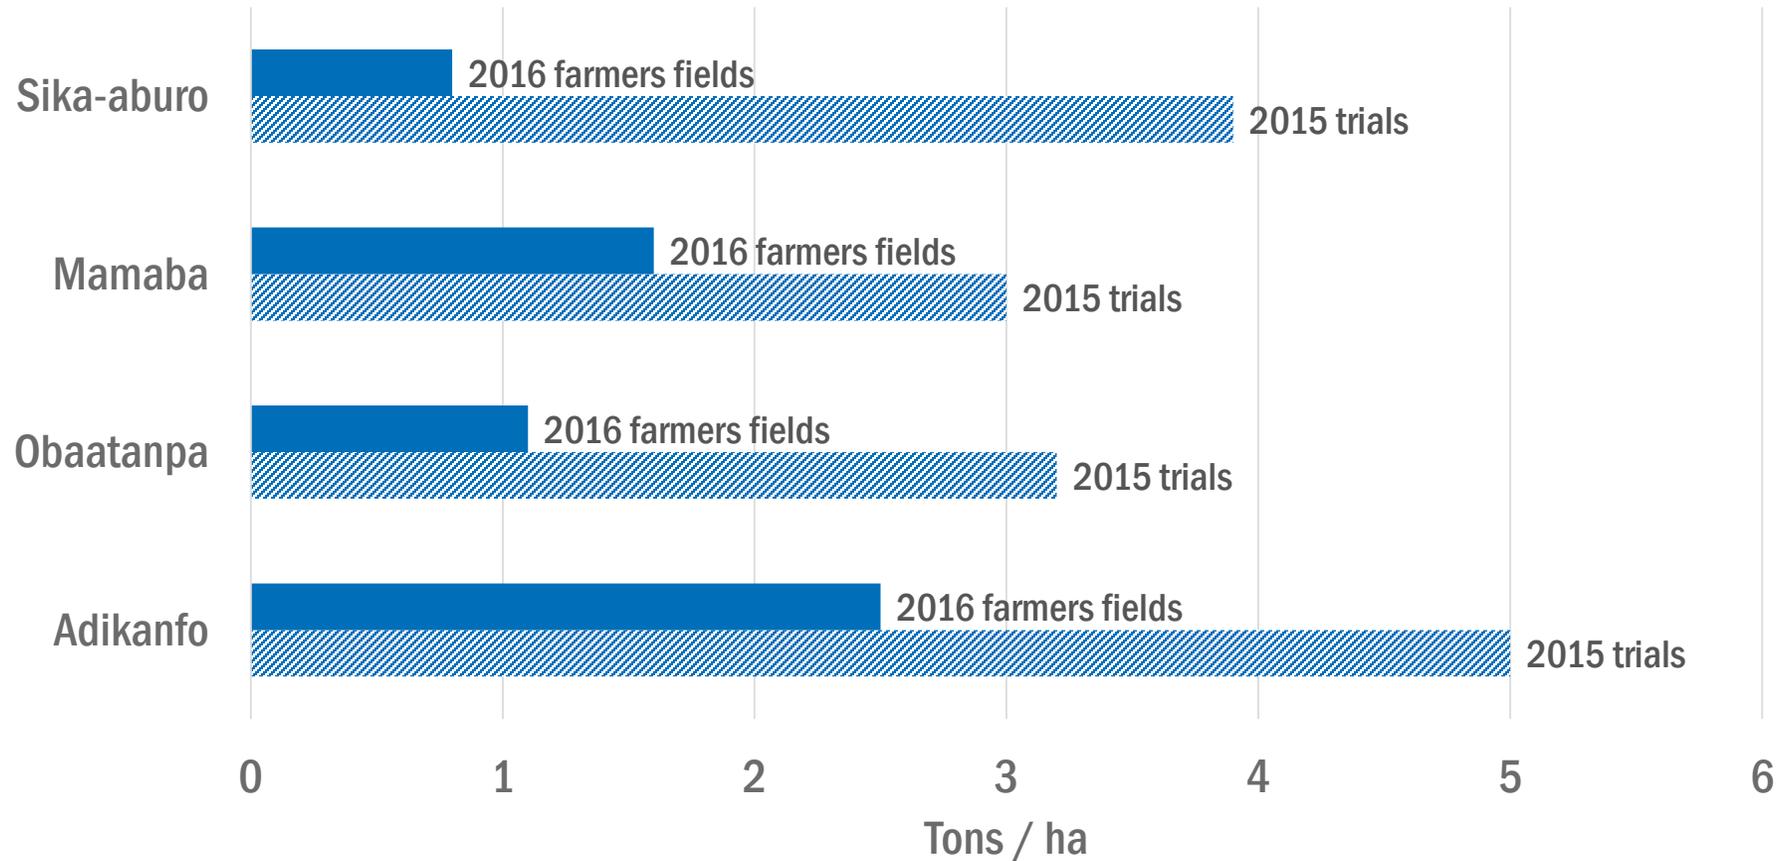

INPUT MARKETS

- **Free delivery and community marketing did not increase demand for inputs**
- **Demand was driven by expectations given the availability, timing, and value of subsidies for inputs**

Topography and Crop Choice

Community Extension Agent (CEA) treatment

- One month residential training
- ≈ 30 messages to be delivered, weekly, to 10 farmers; videos on tablets, managed by farmer history and current activities
- 2014 Initial focus on maize
 - 2015 Extended to legumes and female farmers
 - 2016 Meetings opened to others in community

CEA treatment

- One month residential training
- ≈ 30 messages to be delivered, weekly, to 10 farmers; videos on tablets, managed by farmer history and current activities
- 2014 Initial focus on maize
 - 2015 Extended to legumes and female farmers
 - 2016 Meetings opened to others in community
- Feedback – approximately 12,000 questions/year
- 75% of treatment farmers said the CEA made a “very” or “extremely positive effect” on their lives.
- 98% of treatment farmers agreed with the statement “Meeting with a CEA has led me to change some part of my farming practices.”

Insurance treatment

- *Faarigu* rainfall index insurance; developed with GAIP; drought only
- Marketing within communities by CBM open to all
- Introductory grants of \approx \$15 of insurance to treatment
- “Heavy” insurance comparable to earlier study

Input marketing treatment

- Network of 10 input dealers and 60 Community Marketing Agents
- Catalogue available immediately at harvest
- Shipment to community provided

- Subsidy program
- 2014, 2015 FS

Forecast treatment

- Ignitia forecasts
- 2 day ahead via text early AM
- 2015, 2016 FS

Market Price Information treatment

- Esoko price information
- 2015, 2016 FS
- Output prices at 6 northern markets

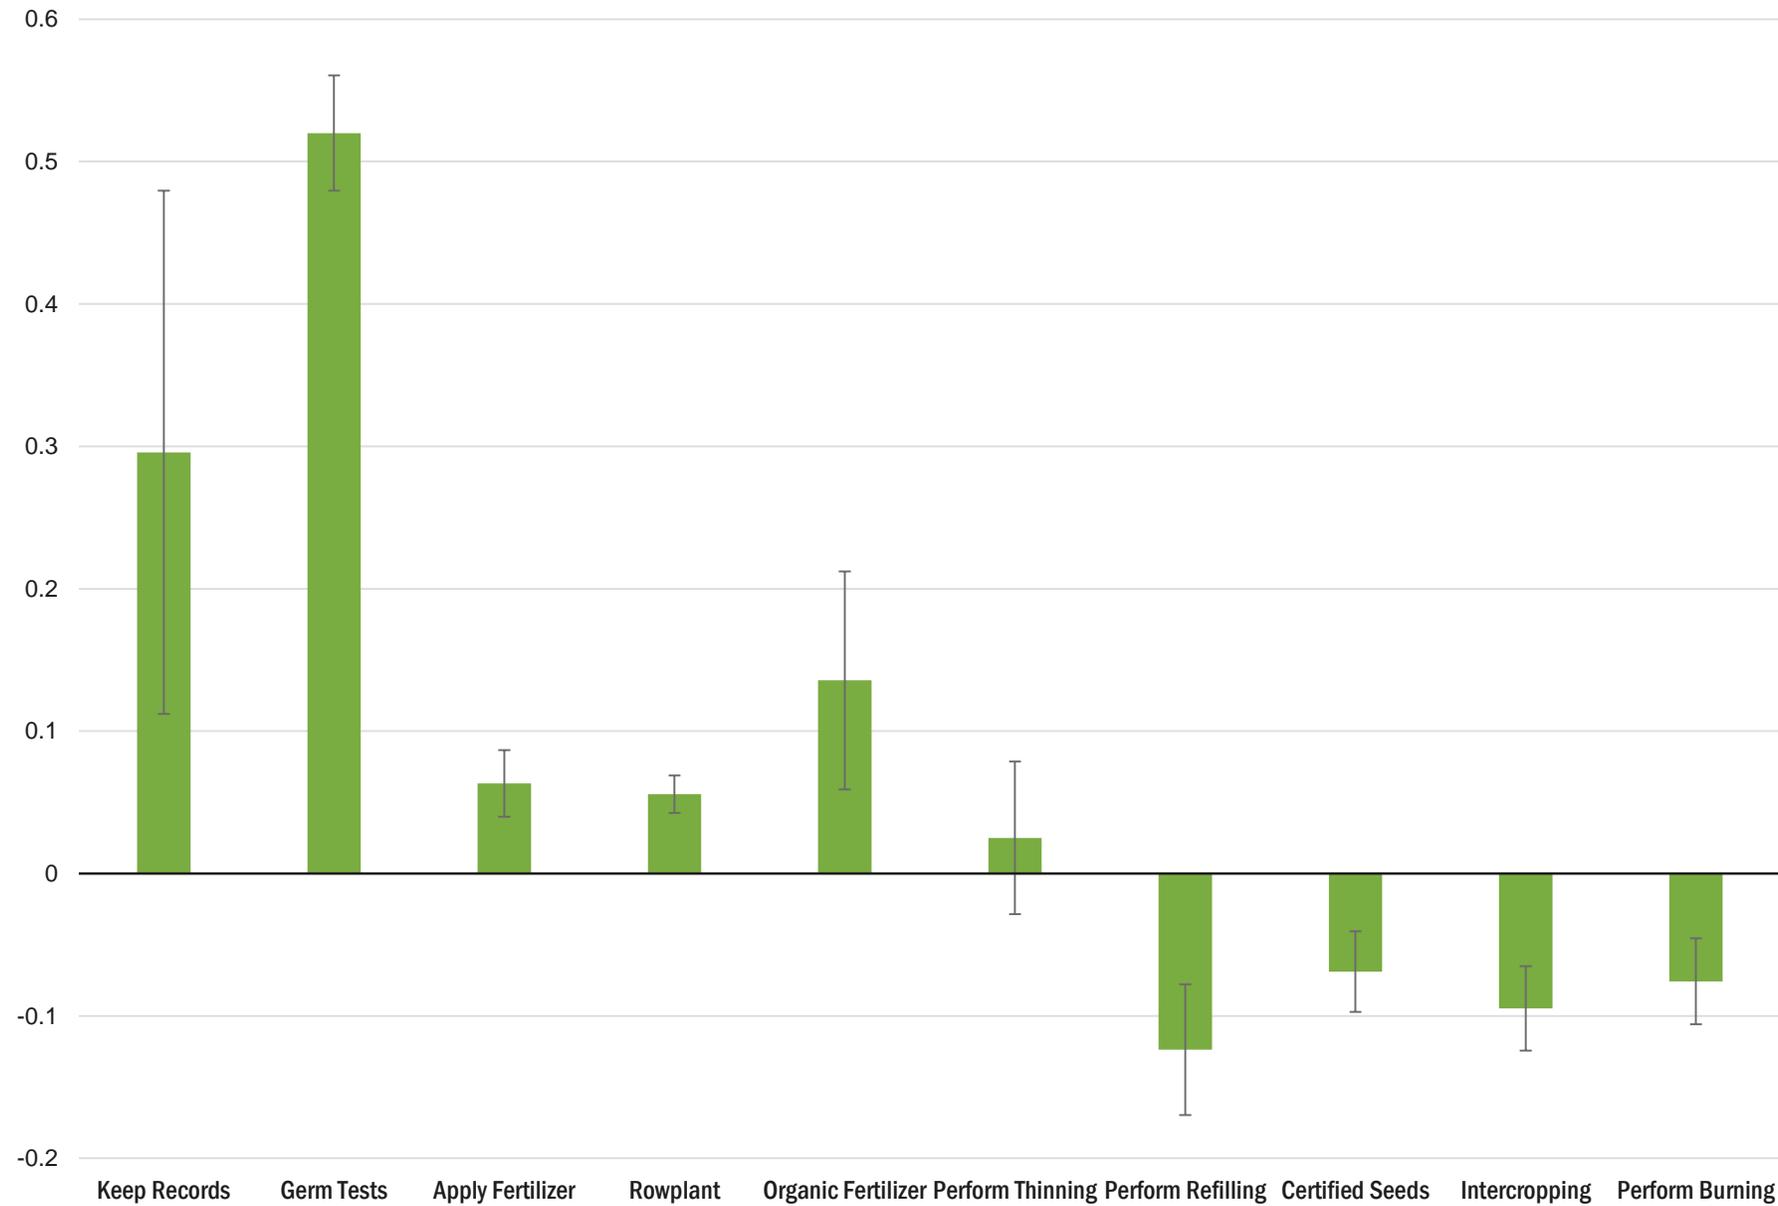

Overview of Preliminary Results

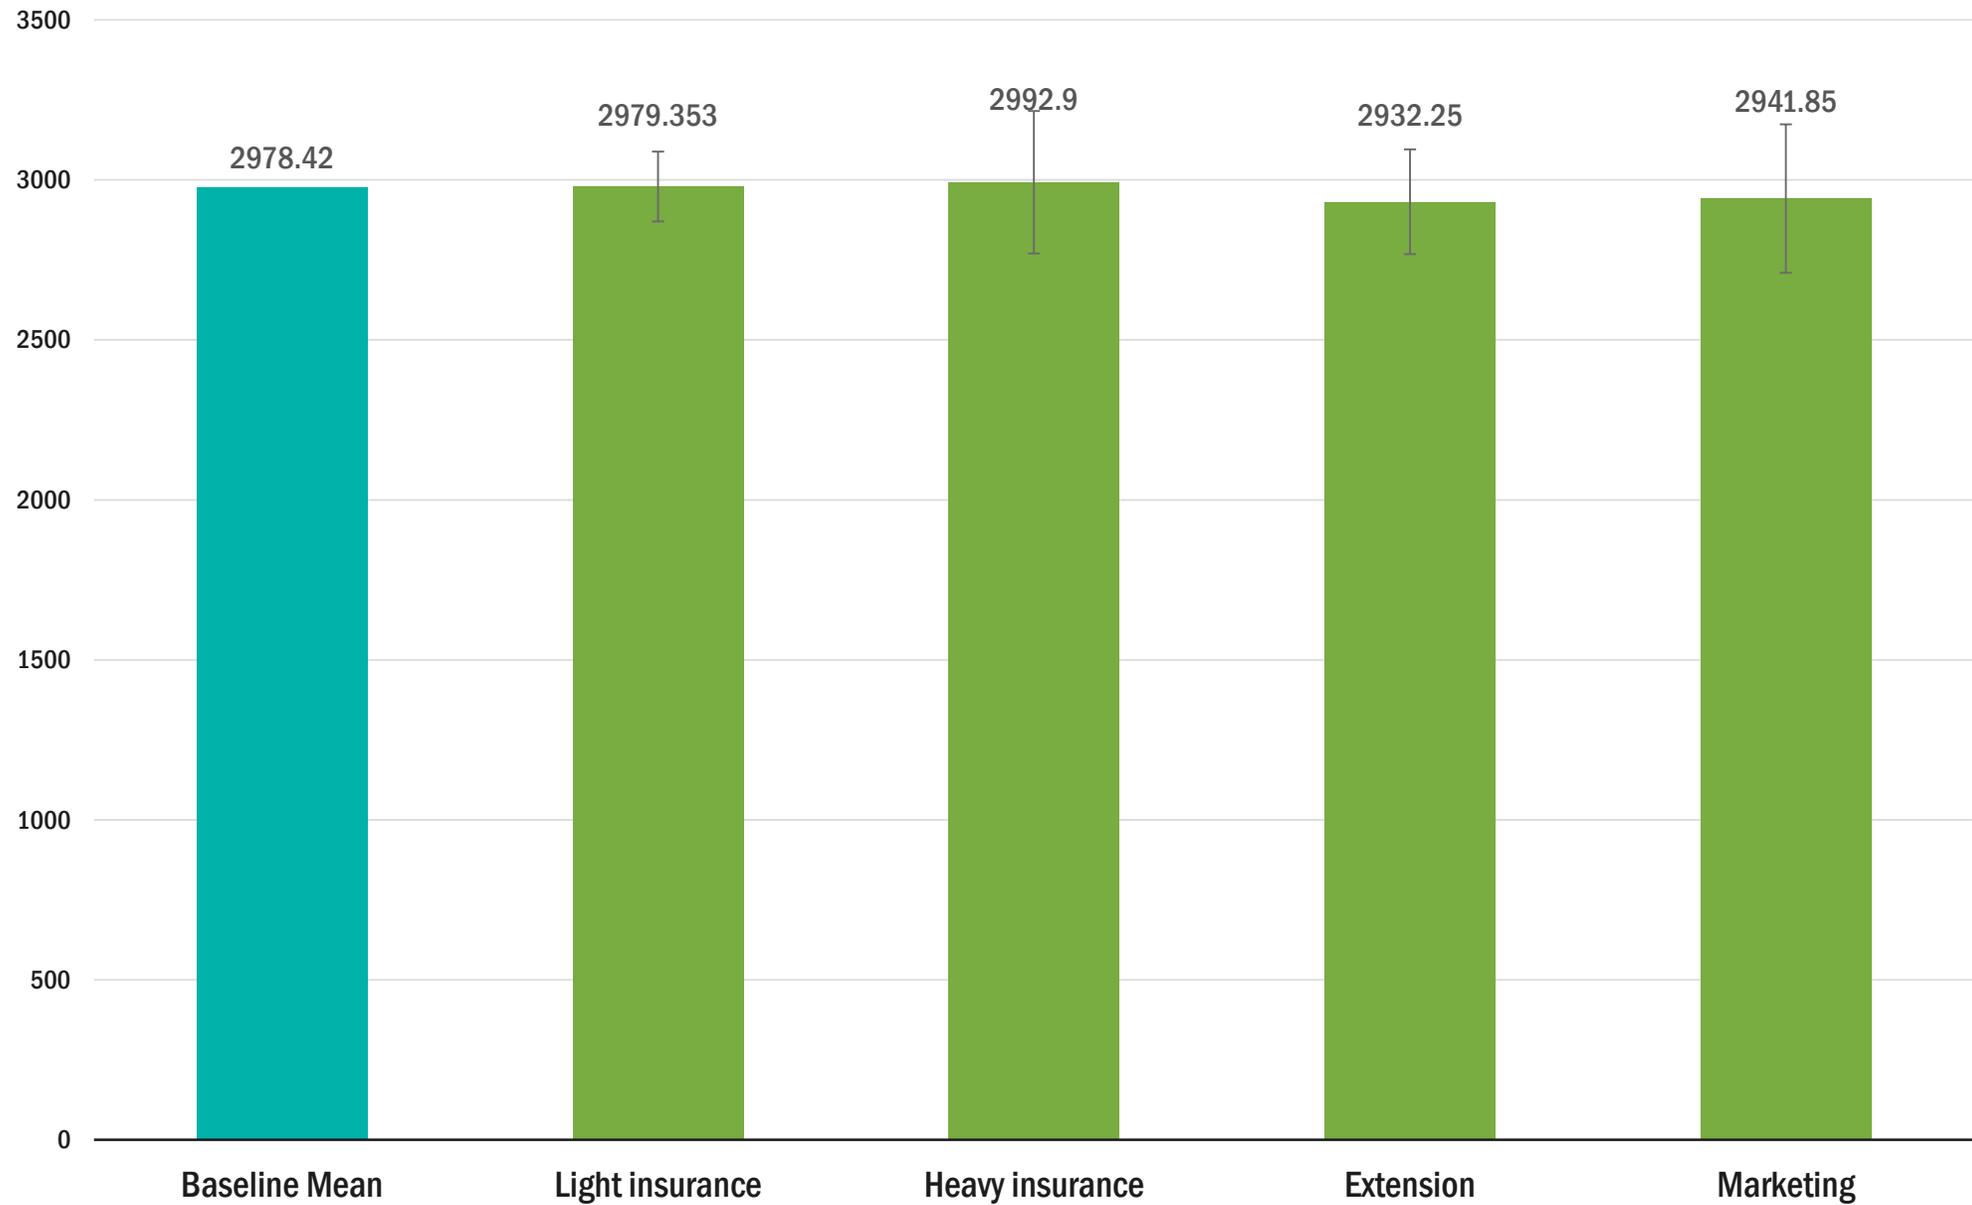

Note: These results are preliminary and may change after further analysis

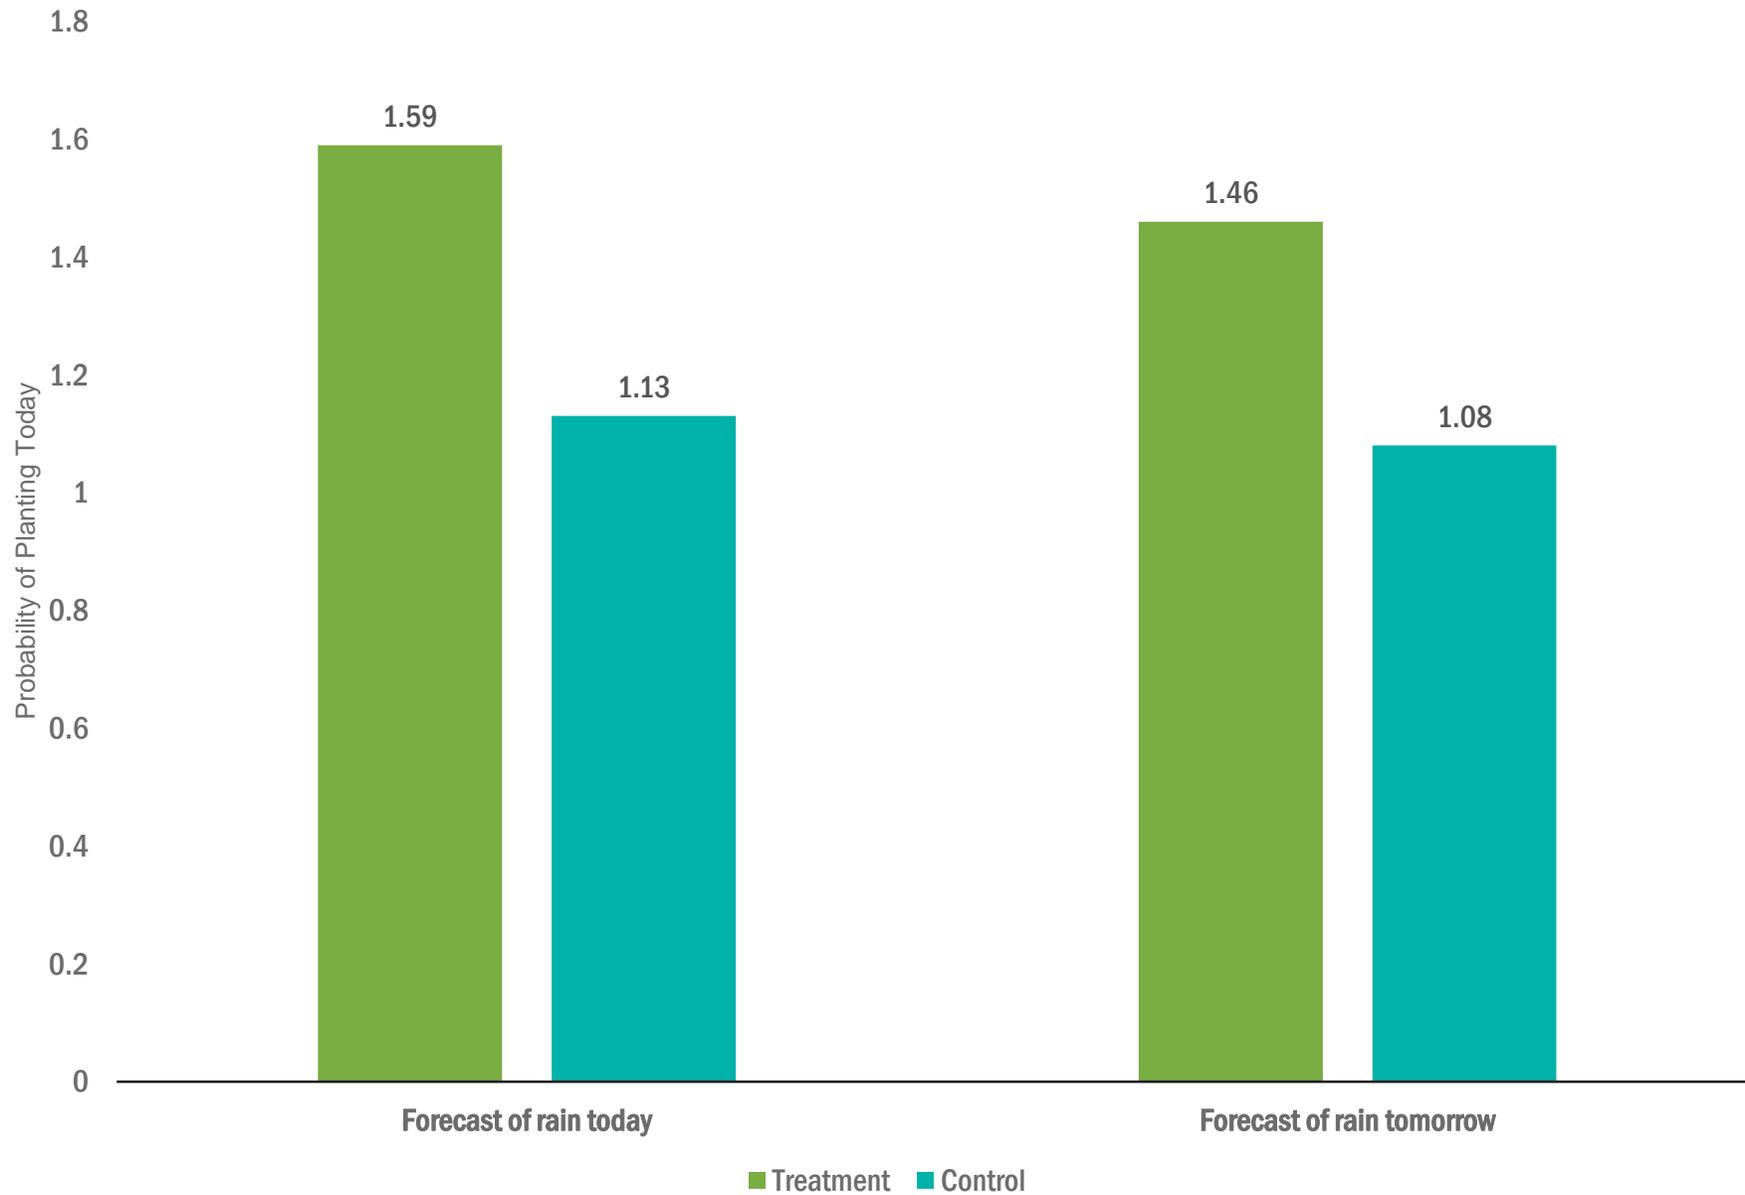

Adoption of New Practices

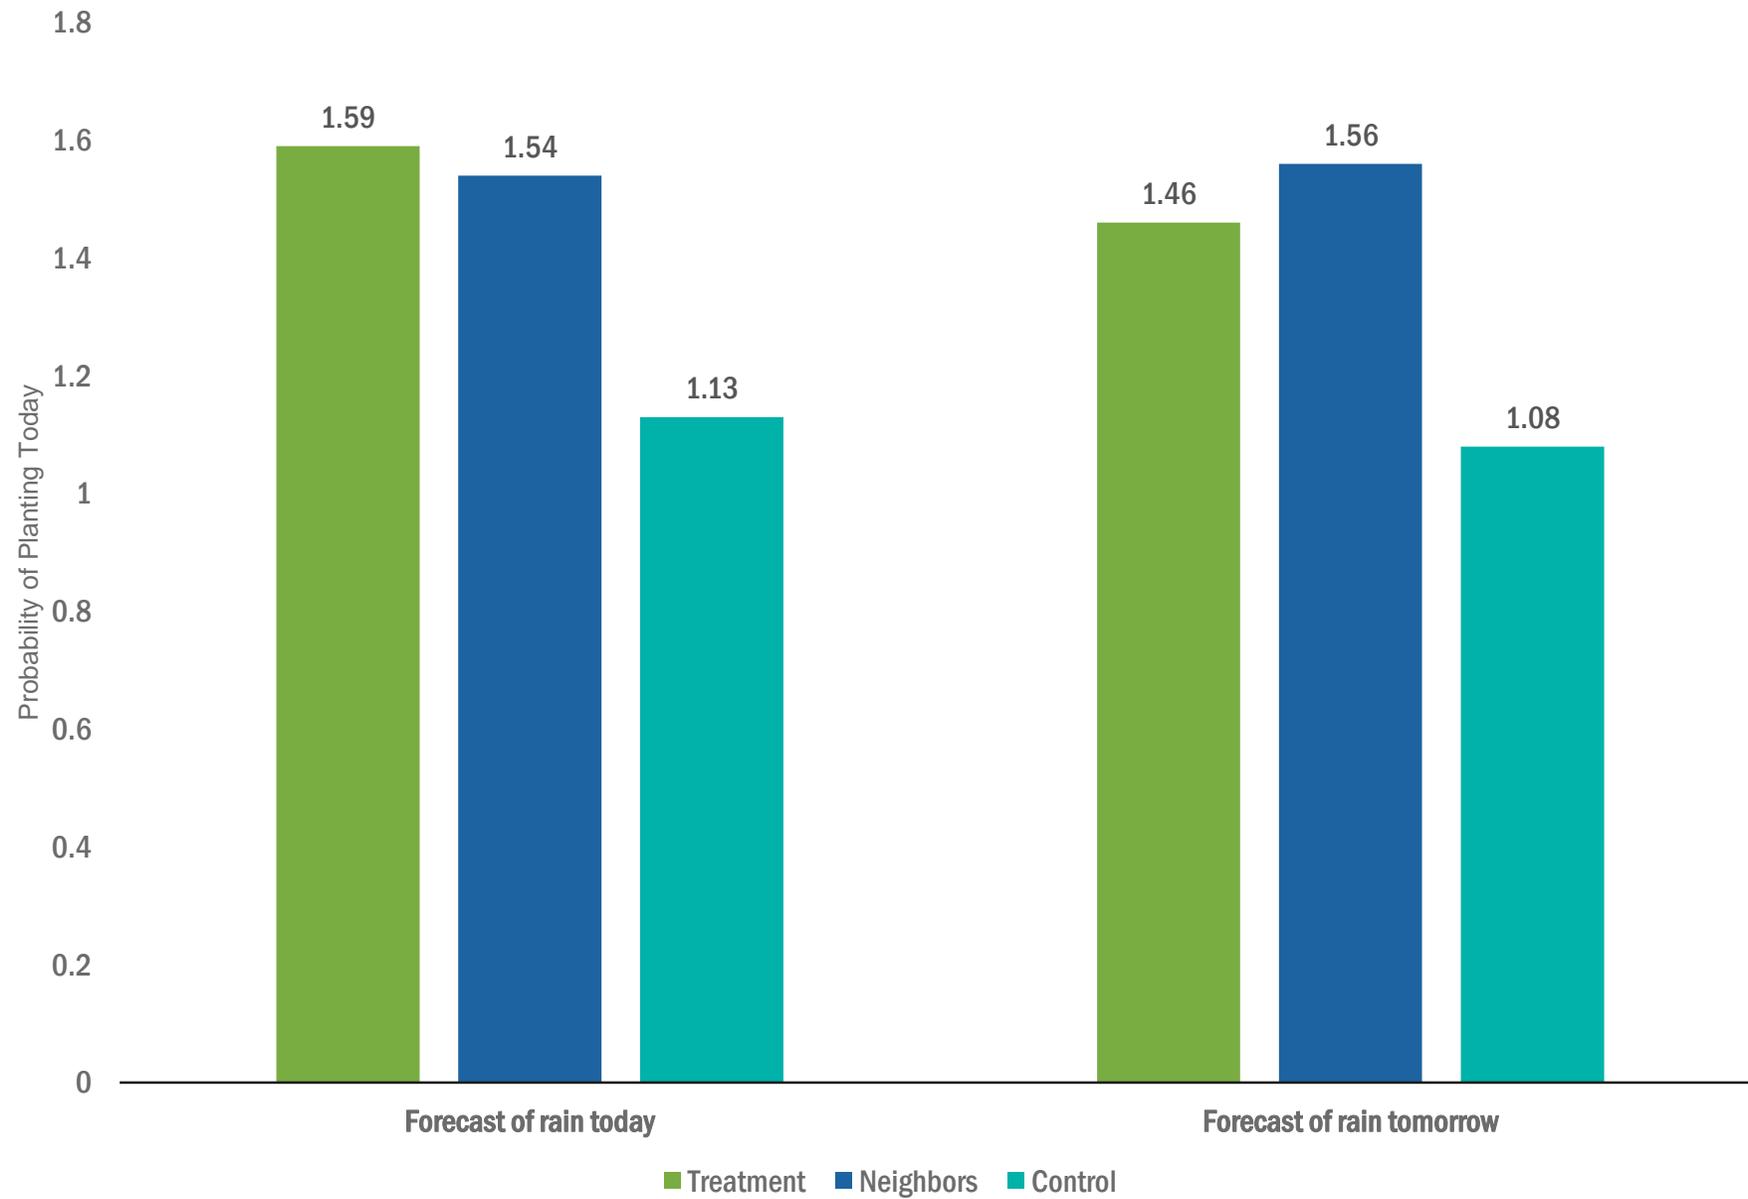

On average, the programs studied did not increase farmers' output

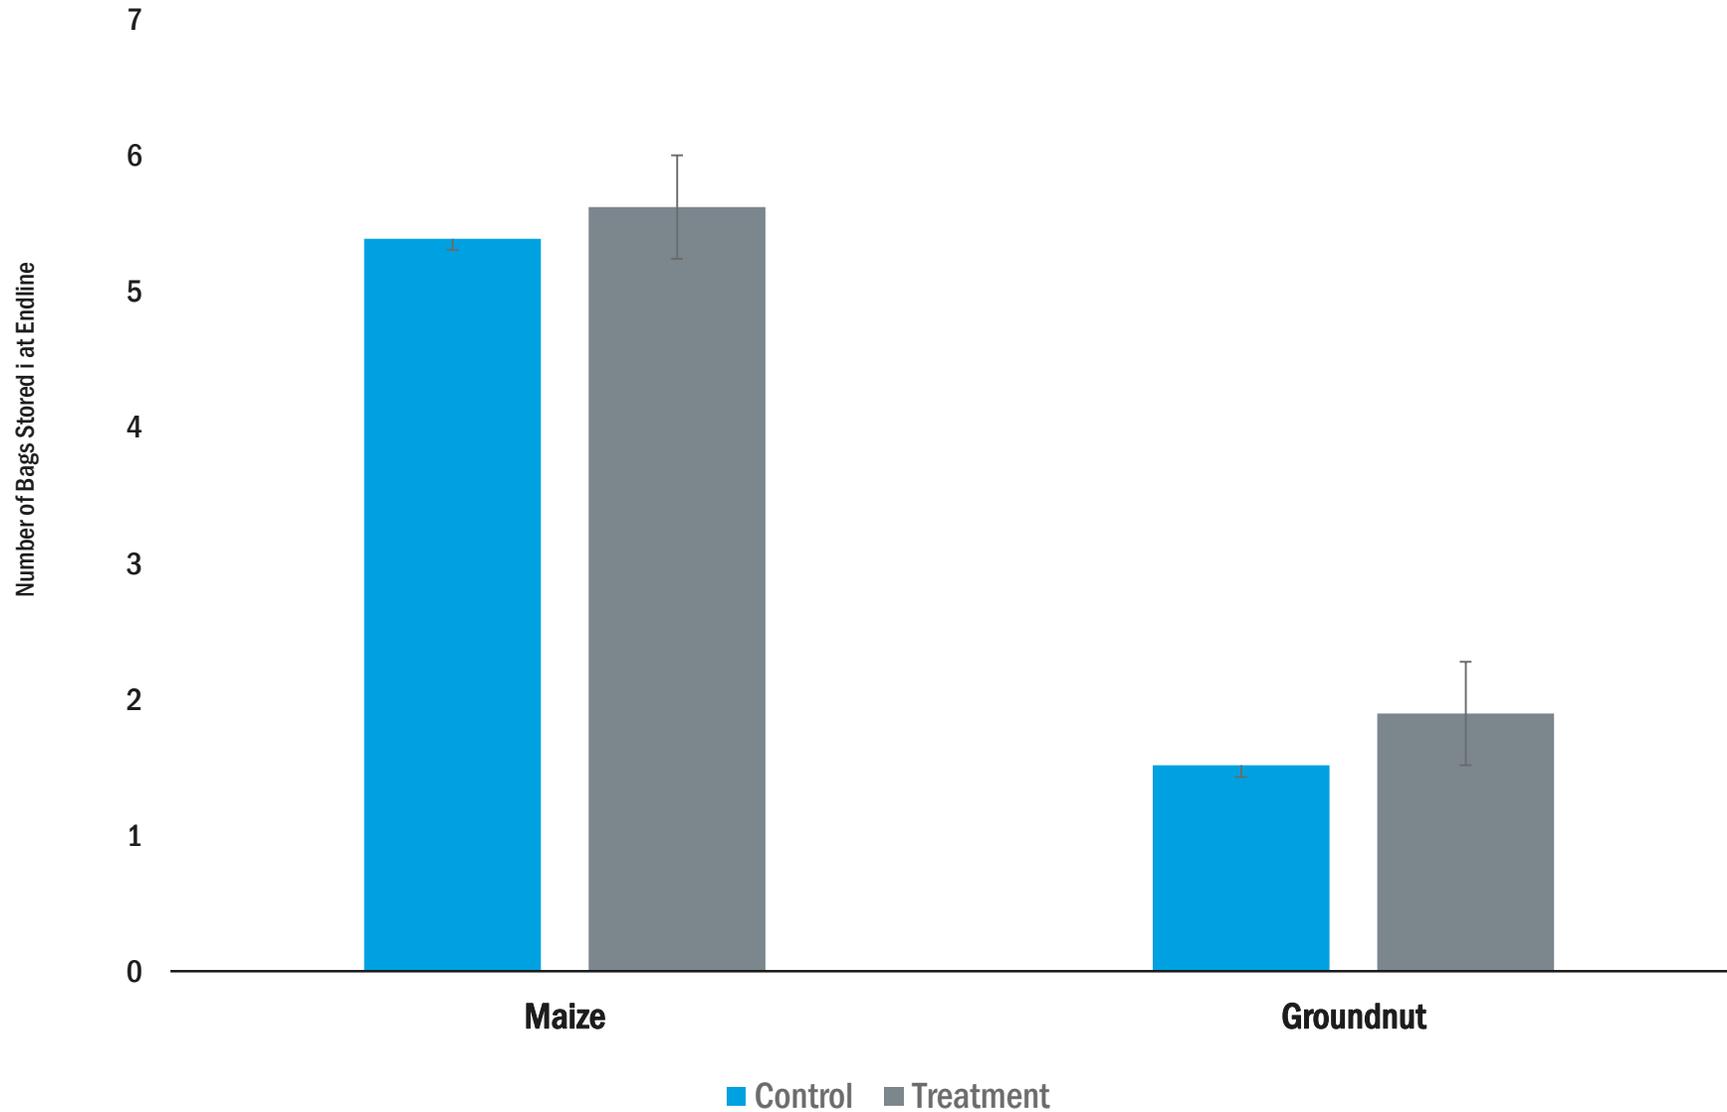

Households who got weather forecasts were more likely to plant in advance of rain

Information spreads quickly—their neighbors were also more likely

Market Price Information changed how farmers stored crops

Conclusions and Policy Lessons

- **Community Extension Agents increase farmer knowledge and improve farmer practices**
 - **Appropriate timing of message delivery matters**
 - **Technology can be harnessed to leverage human resources**
- **Adoption of improved practices by some farmers did not generate an increase in average yields or profits the full group of farmers**

Conclusions and Policy Lessons

- **There is limited demand for rainfall index insurance**
- **Free delivery and community marketing did not increase demand for inputs**
- **Farmers adjust timing of planting and agrochemical application in response to text messages of 48-hour weather forecasts**
- **Text messages regarding current prices at major markets influence decisions regarding storage**

Conclusions and Policy Lessons

- Our seed comparison suggests that currently-available improved seeds can perform better than the most commonly used seeds
 - An imported hybrid variety was the most profitable in these trials
